The difference is in the data

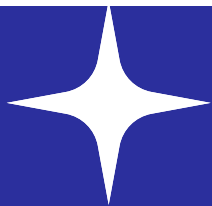

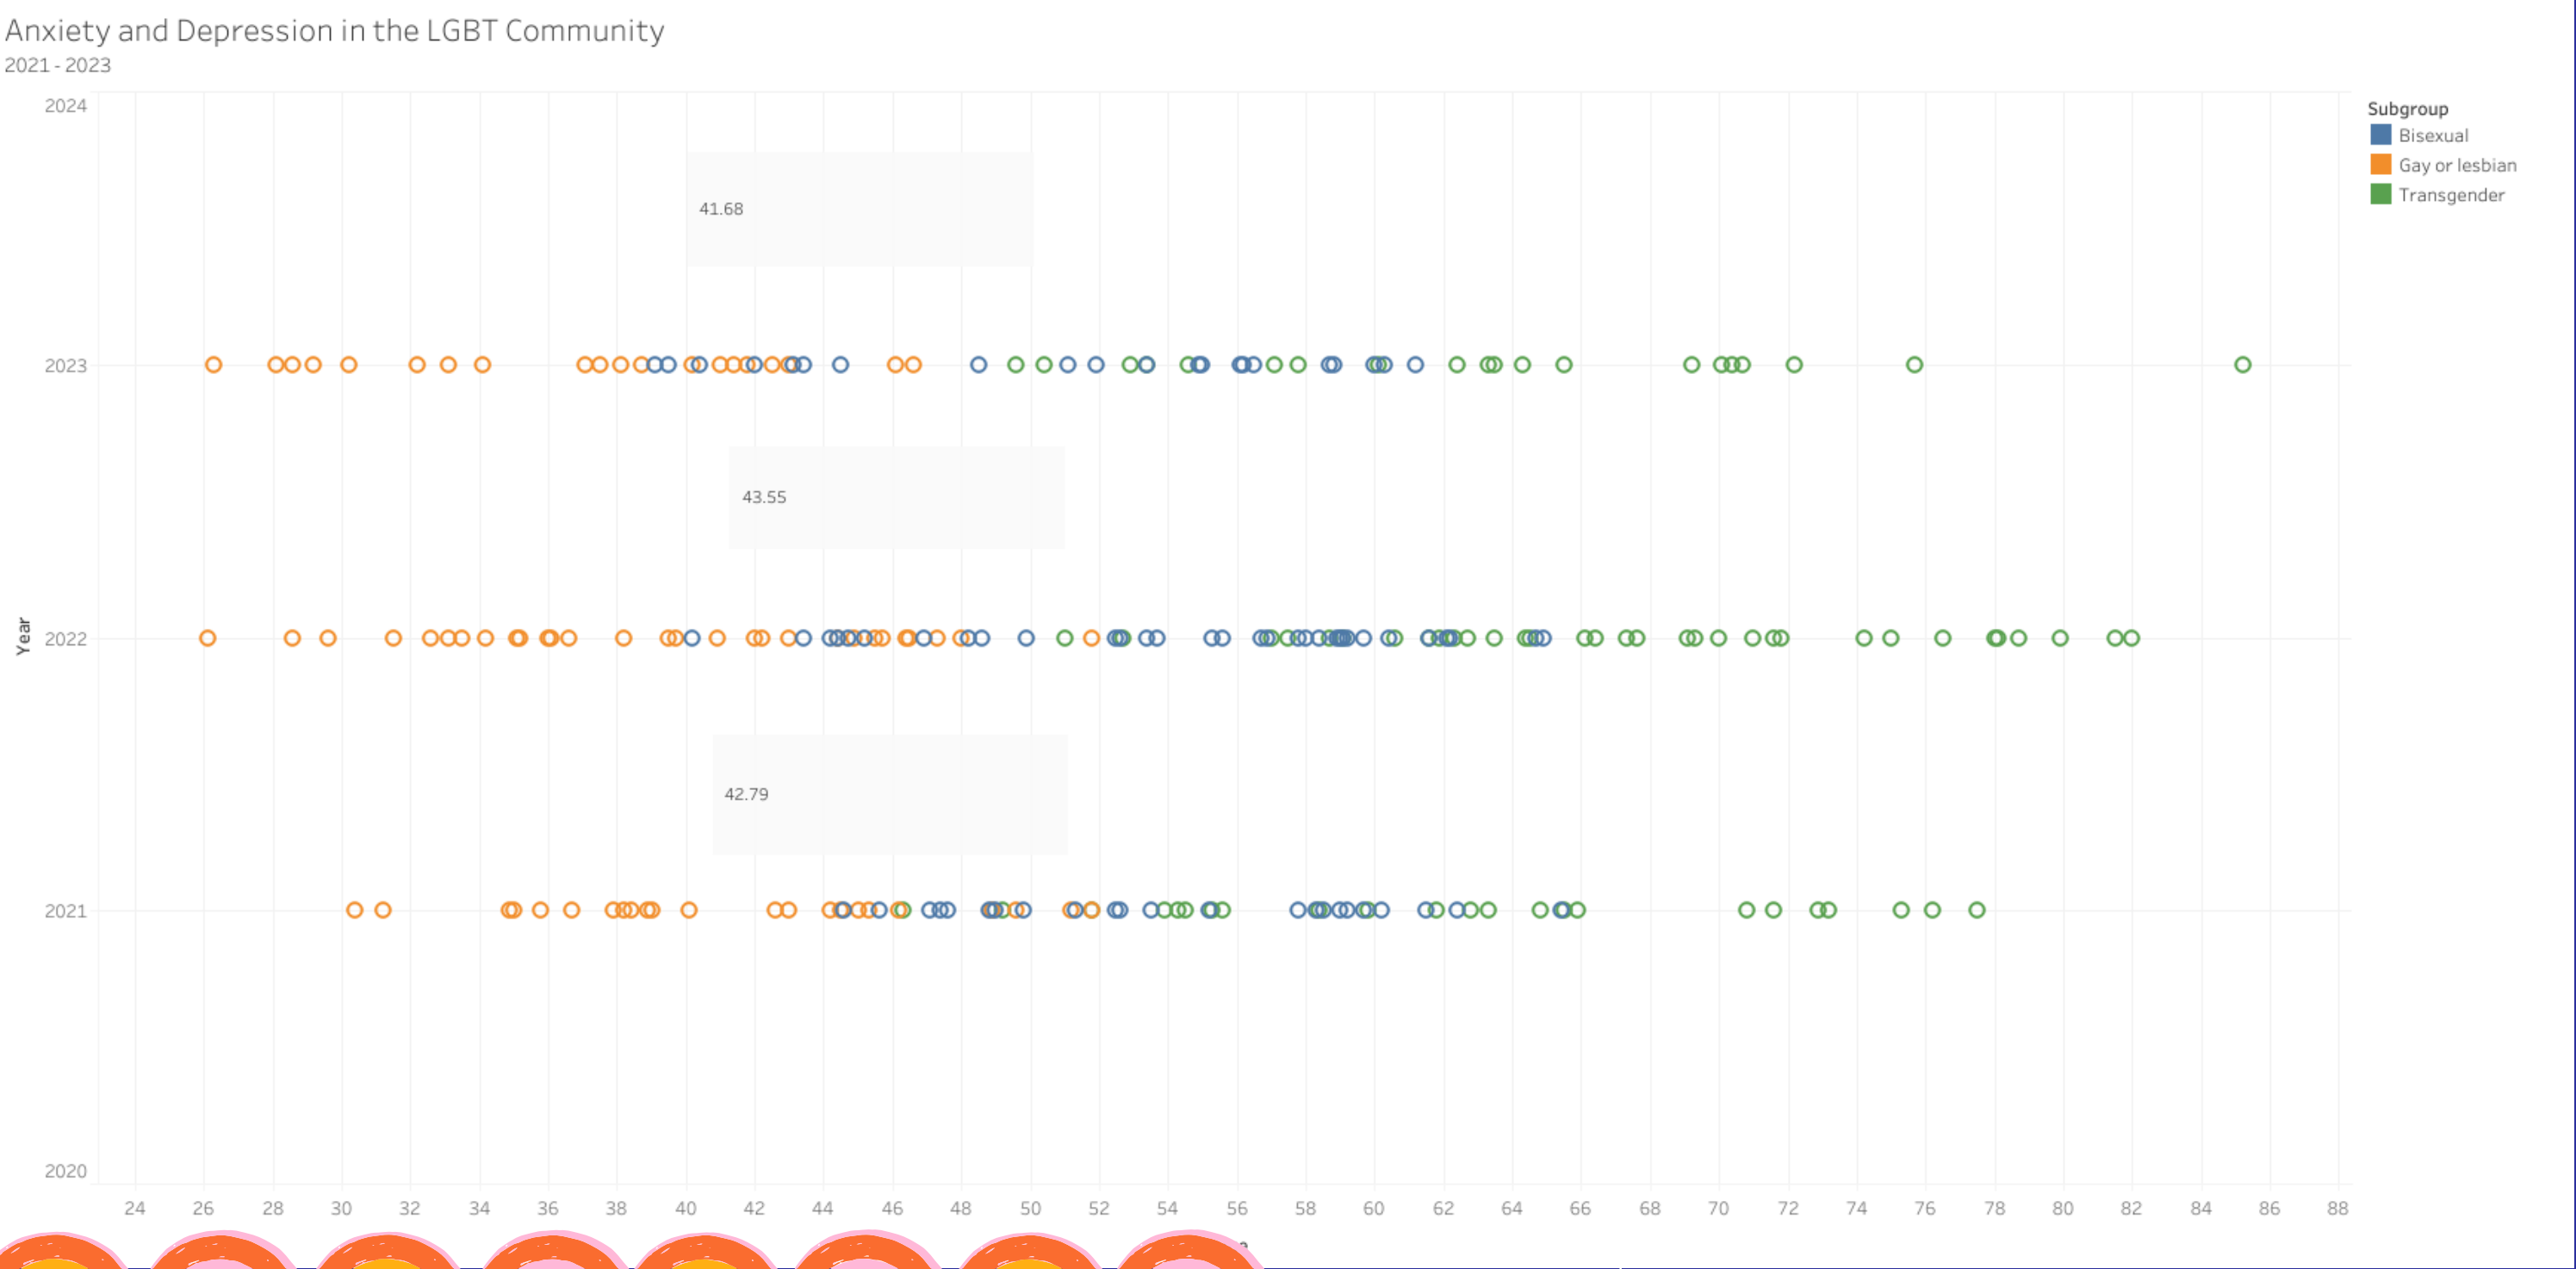

You'll notice an alarming increase of
symptoms in the LGBTQ+ and disabled
communities when compared to their peers.

This could be for many reasons not
mentioned here - but asking why is the first
step to seeking improvement.

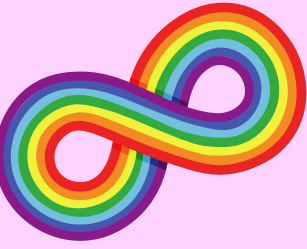

Transgender Data

Gay, Bi, and Lesbian Data

Living with a Disability

Conclusion ✨

- Trans individuals have a 128% higher occurrence of symptoms than Cis peers
- LGBT+ individuals have a 71% higher occurrence of symptoms than Straight peers
- Disabled individuals have a 149% higher occurrence of symptoms than non-disabled peers
